Improving optical pipeline through better alignment and calibration process

November 18, 2021

1 Introduction

Dimensional metrology and alignment methods are significant and vital during different manufacturing processes. Dimension inspection processes play a crucial role in controlling the position accuracy of production [1]. P. Maresca et al identified the precise, safer and more flexible [2]. The highly-automated measuring and control systems demanded by the industries could use several approaches to metrology process is used on industrial systems, components and objects to perform inspections, alignment and measurement [3]. It offers economic arguement measurement information infrastructure's potential impacts on cost-effectiveness and risks for IoT measuring instruments adoption [4]. Metrological systems are based upon the principle of a good alignment system. The inspection and alignment of larger scale components with a strict precision were concerned in the high-tech and heavy industry [1]. Good alignment inspection is one of the most important methods to ensure safe measurement [5].
